Curated Slow. Delivered Fast.

Quick Commerce for India's top 10% consumers.

Executive Summary

Project Overview

Data analytics to optimize Quick Commerce for India's top 10% consumers, focusing on category and clubhouse performance.

Category Performance Analysis

Assess order counts, visibility, and satisfaction across 16 segments. Recommendations: Boost underperforming (Breads, Breakfast), leverage high-conversion (Health & Hygiene), capitalize on Low-Fat preference.

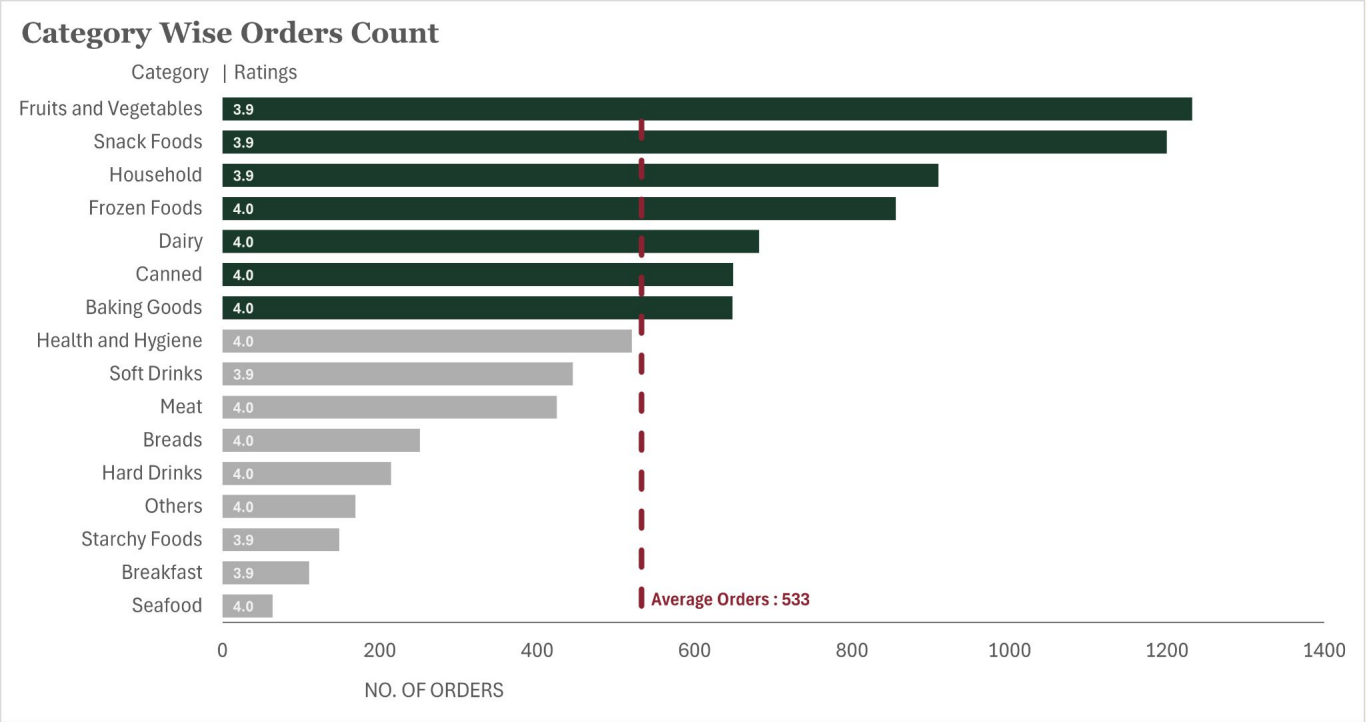
Clubhouse Performance Analysis

Evaluate store types/sizes across tiers, review revenue trends (2012, 2018 jumps), and target underperforming but efficient clubhouses (like OUT019) for improvements.

Out of 16 Categories only 7 Categories are Crossing Average Order Count

Despite being essential categories, (**Bread, Breakfast, and Starchy Foods**) are seeing significantly lower volume (all below 300 orders).

Customer satisfaction (ratings) is stable across all categories, hovering between **3.9 and 4.0**, suggesting that lower order counts in certain areas are likely due to visibility or availability rather than quality issues.



Recommendations

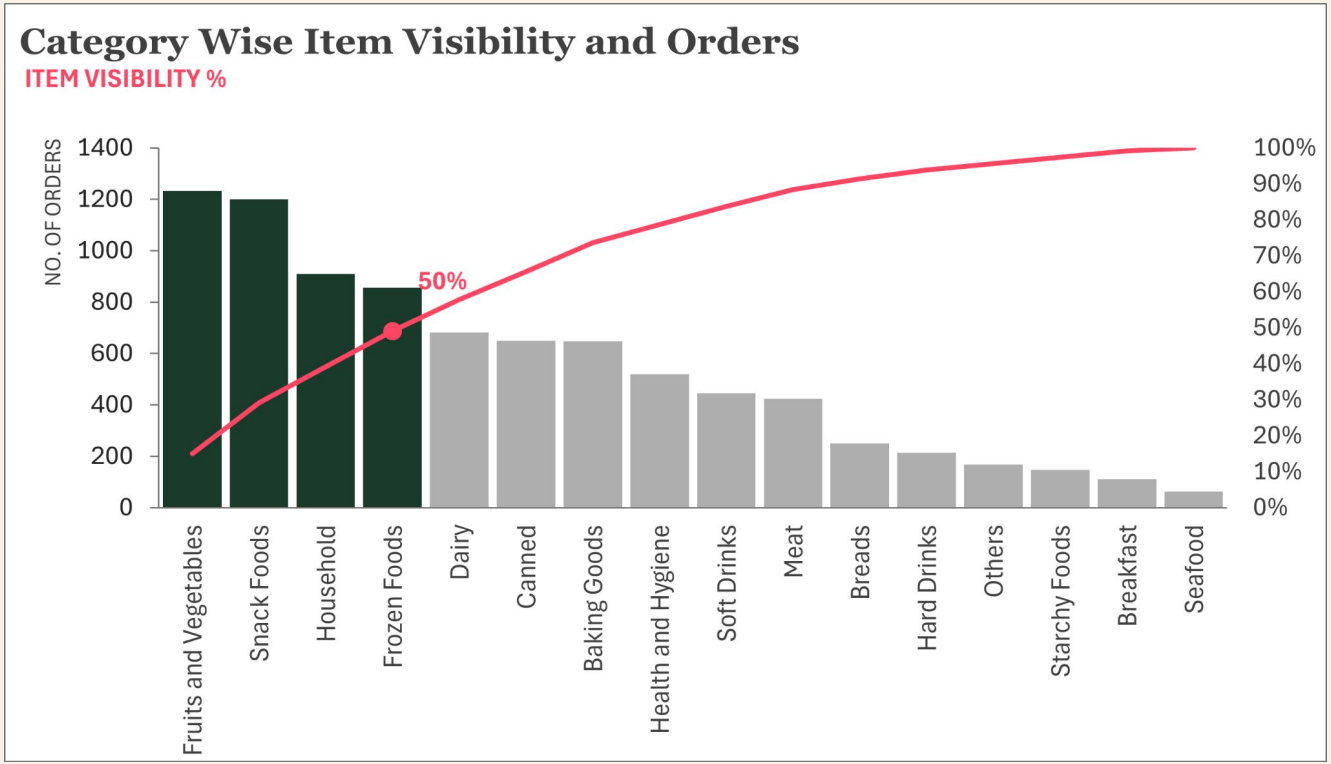
Breakfast & Breads are currently underperforming, run targeted morning campaigns (7 AM – 10 AM) with **"Healthy Breakfast in 30 Minutes"** messaging to capture this untapped market.

Since **Seafood** has the lowest order count but a high rating (**4.0**), it suggests a small but **very satisfied loyal base**. Consider a **"Weekend Special"** for premium customers to increase frequency without overstocking.

4 Categories are receiving 50% of the Item Visibility on the Platform

The **top 4 categories— Fruits & Vegetables, Snacks Foods, Household, and Frozen Items**—receive 5**0% of screen visibility,** which directly translates to 50% of the total platform orders.

Categories like Health & Hygiene are noted to have a higher conversion rate, suggesting they are currently under-leveraged and could contribute significantly more if given higher visibility.



Recommendations

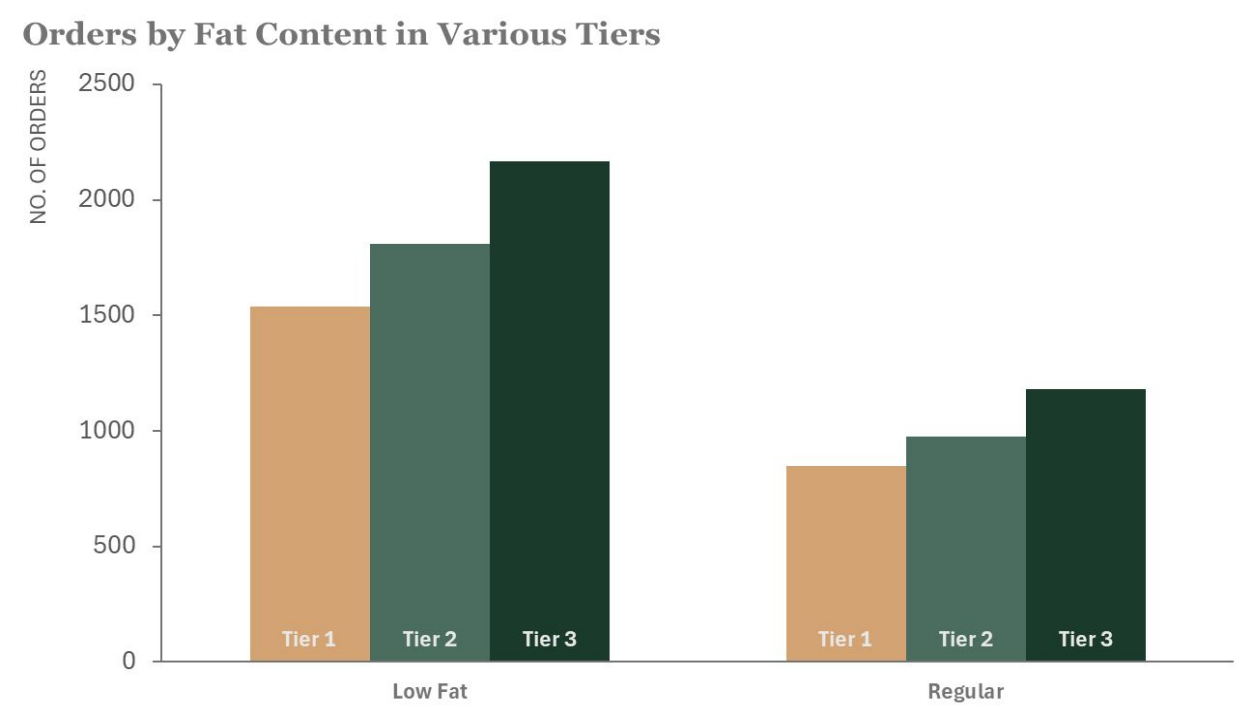
Prioritize efficient screen visibility by increasing allocation to high-conversion categories, such as **Health & Hygiene.**

Reallocate visibility away from occasionally consumed categories with varied preference (like Meat and Seafood) to free up screen space for the emerging, high-potential segments.

Low-Fat Products Preferred in All Tiers, Account for 65% of Total Orders.

Item Fat Content	% of Total Orders
Low Fat	65%
Regular	35%

Low-Fat products are strongly preferred across all Tiers, currently making up **65% of total orders** and signaling a clear, widespread trend towards healthier diets.



Recommendations

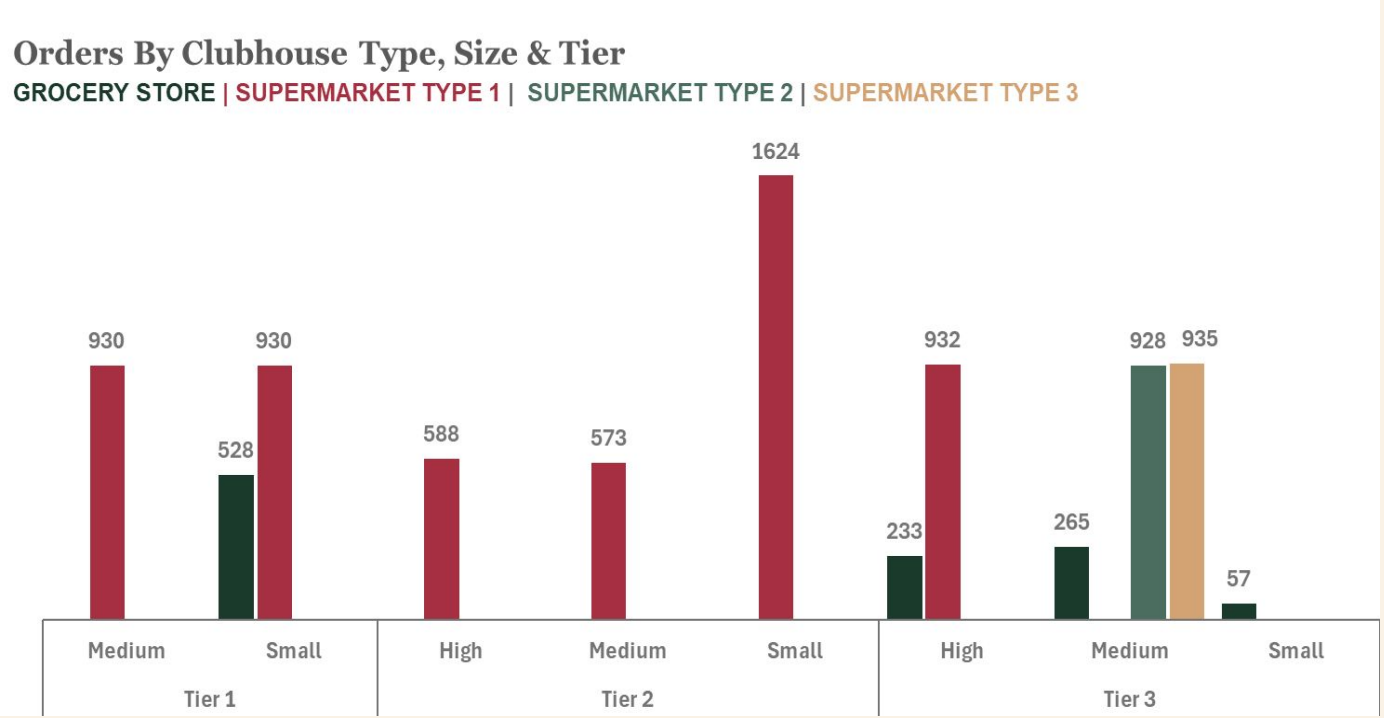
Replace products in low-performing categories **(Hard Drinks, Soft Drinks, and Breakfast)** with healthier, Low-Fat alternatives to achieve a **target of 80%** of total non-Dairy orders from Low-Fat items.

Focus specifically on the **Breakfast category,** a daily consumption segment, by **increasing item visibility** and introducing a wider selection of **healthy, Low-Fat choices** to capture its currently untapped market potential.

Small Supermarkets Lead, Tier 3 Needs Shift to Medium-Sized Type 2/3 Clubhouses

Small Supermarket Type 1 Clubhouses are strong performers in all Tiers except Tier 3, with the small size performing better overall, particularly in **Tier 2,** which alone generated **1,624 orders.**

Small Grocery Store Clubhouses perform better in Tier 1 compared to Tier 3, where customers prefer local vendors for grocery needs.



Recommendations

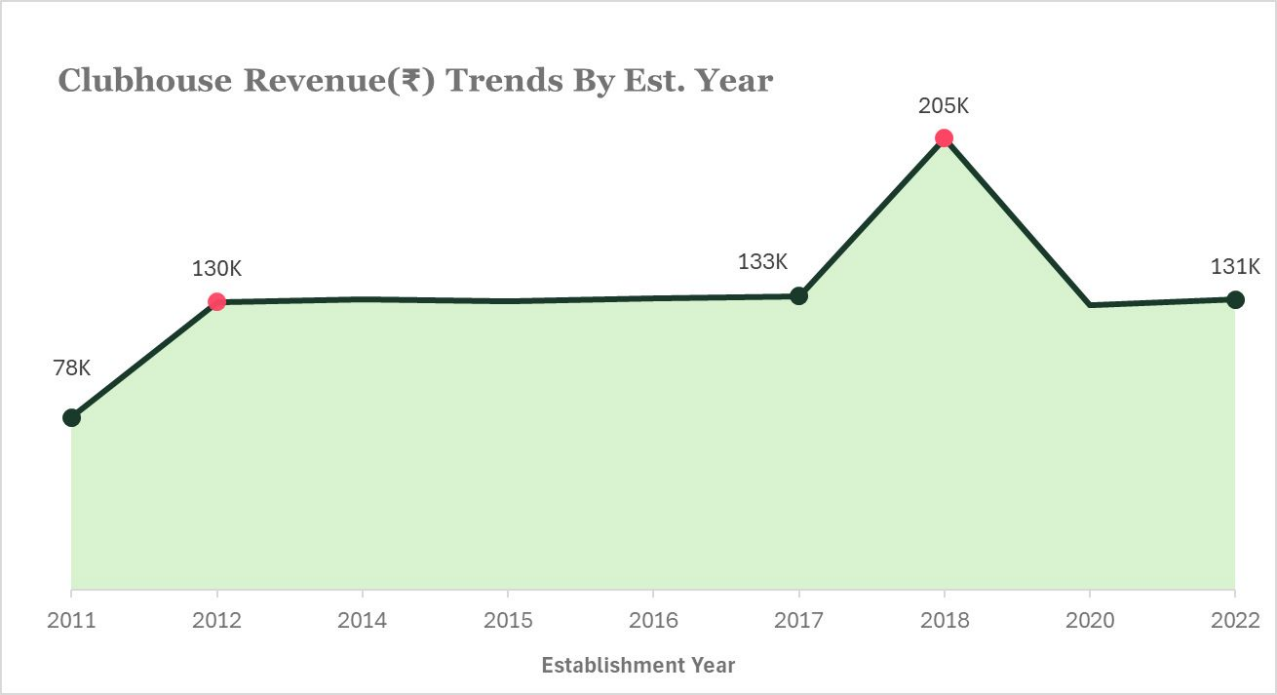
For Tier 1, small Grocery and Supermarket Type 1 clubhouses are recommended, offering organic and fresh groceries for the **top 10% of customers** with high-quality expectations.

In Tier 3, the focus should shift away from Grocery Stores to **medium-sized Supermarket Type 2 or 3** Clubhouses to satisfy the aspirational needs of the top 10% of customers.

Revenue Spikes in 2012 & 2018 Traced to Key Clubhouse Performance and New Establishment

Year 2012 have seen **4% Rise in Revenue** compared to 2011. This is because of the **Clubhouse OUT049** which is generating more Orders in Tier1 as compared to OUT010 in Tier 3.

A sudden revenue jump occurred in **2018** due to the est. of Clubhouses **(OUT019 and OUT027)**. Despite the 2018 rise, revenue performance remained flat in both 2020 and 2022.

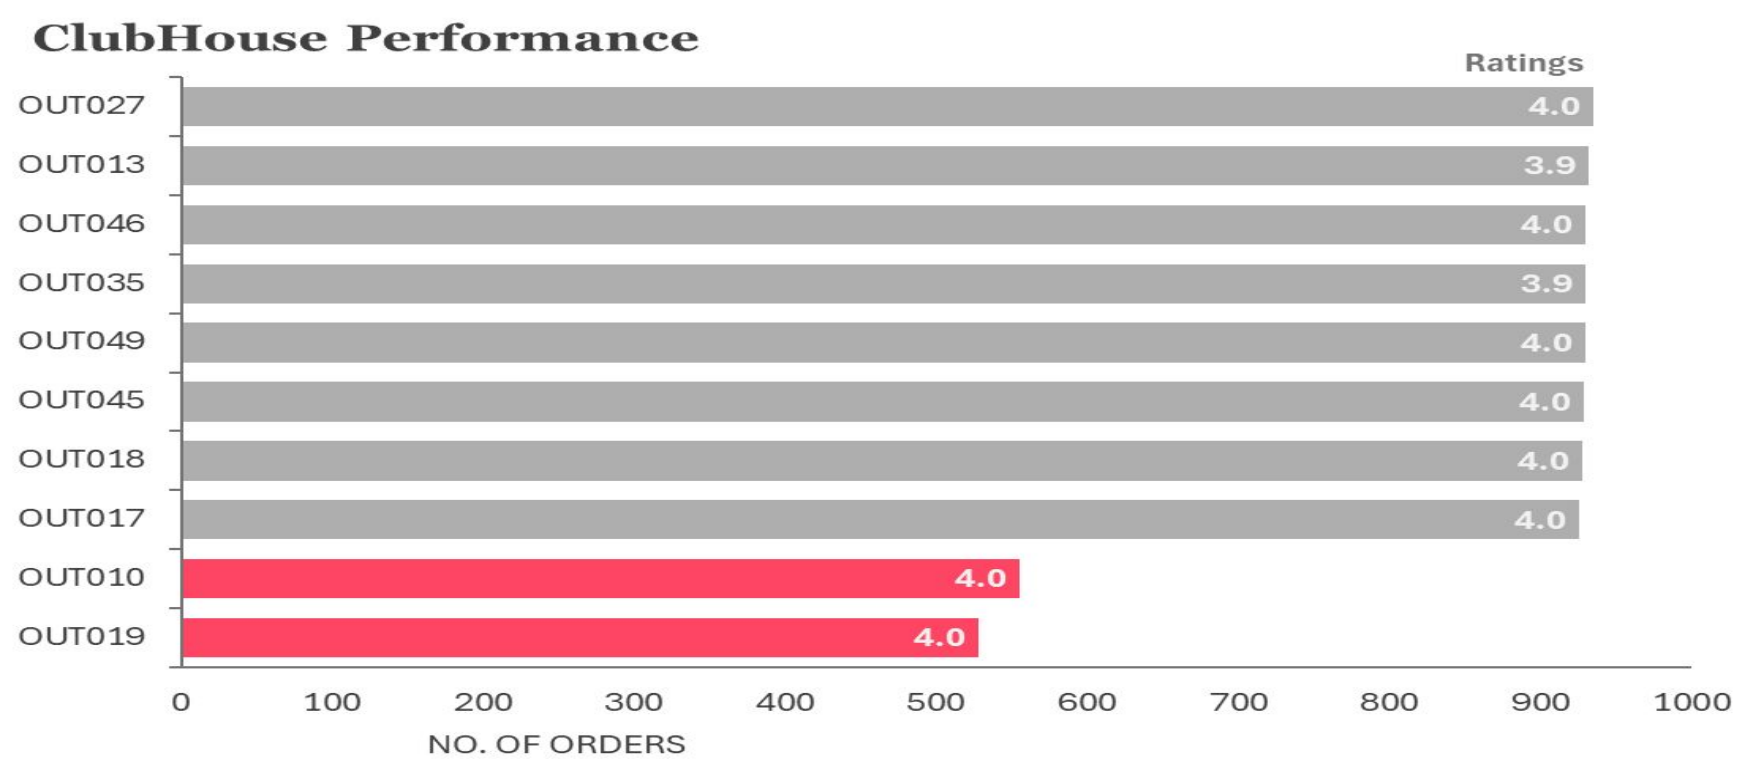


Est. Year	Clubhouse_ID
2011	OUT010
2012	OUT049
2014	OUT013
2015	OUT045
2016	OUT046
2017	OUT035
2018	OUT019
	OUT027
2020	OUT017
2022	OUT018

Despite High Ratings, OUT010 and OUT019 Lag Behind in Performance.

Despite having **high customer ratings,** Clubhouses **(OUT010 and OUT019)** are performing worse than other Clubhouses.

Clubhouse OUT019 is specifically performing below the platform's **Average Order Count of 533.**



Drill Down on Worst Performing Clubhouse (OUT010 & OUT019)

Clubhouse_ID	Est. Year	Clubhouse Location	Clubhouse Size	Clubhouse Type	Total Orders
OUT010	2011	Tier 3	High	Grocery Store	233
			Medium	Grocery Store	265
			Small	Grocery Store	57
OUT019	2018	Tier 1	Small	Grocery Store	528

Clubhouses (**OUT010 and OUT019)** are **Grocery-type** and underperform compared to Supermarket clubhouses.

OUT019 does not cross the **Average Order Count of 533,** but is more efficient, it generates **528 orders from one store** versus OUT010 555 orders from three stores.

Recommendations

Focus on **increasing customer trust** in **OUT019** by promoting fresh and organic groceries for Tier 1.

In Tier 3, concentrate on a **single medium-sized grocery store** for the top 10% of customers,Instead of three different sizes.

Thank you for your valuable time to view this project

Looking forward to your views, suggestion & feedback to improve and work with
